DXF Export

Dialog

Description

Select the layers for the export or export all active layers

Split arcs into workable line segments and specify the segment size.

Flatten only polygons

Select millimeter or inch as unit

DXF outline of fill information is added

Export and specify the place to save

Export and specify the place to save

Export only selected objects

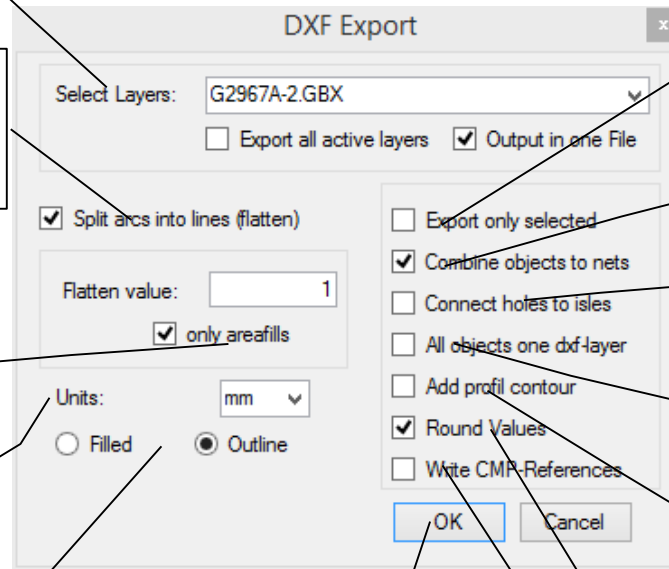

Combine all objects of one net

Connect holes to the outline

Put all objects on one layer

Show the outline of the PCB

All values will be truncated

Export options

Load PCB

Description

- DXF-Export exports PCB data into Drawing Interchange Format. Select „File“ and „Export“ to get to DXF Export.
- Select the layer you want to be exported or just export all active layers.
- You can choose:
 - if only selected objects are exported
 - if all objects of one net are to be combined
 - if holes are connected to the outline
 - if all objects are put on one layer
 - if the outline of the pcb is shown
- Furthermore, specify whether all lengths are to be stated in millimeter or inch.
- You can split arcs into lines, which are easily workable. Type the segment size into the „Flatten Value“ textbox and determine if only surfaces are flattened.
- Determine if you want to color the complete board or only the outline.
- Start the export with „OK“ and select a place to save.
